

Protect All the Skin You're In

☀️ Skin cancer is the most common cancer in the United States, yet most skin cancers can be prevented.

☀️ Every year, there are **63,000 new cases** of and **9,000 deaths** from melanoma—the deadliest form of skin cancer.

Ultraviolet (UV) exposure is the most common cause of skin cancer. **A new CDC study shows that the majority of Americans are not using sunscreen regularly to protect themselves from the sun's harmful UV rays.**

In fact, fewer than **15% of men** and fewer than **30% of women** reported using sunscreen regularly on their face and other exposed skin when outside for more than 1 hour.

Many women report that they regularly use sunscreen on their faces but not on other exposed skin.

Choose sun protection strategies that work.

Use broad spectrum sunscreen with SPF 15+ to protect any exposed skin.

Seek shade, especially during midday hours.

Wear a hat, sunglasses and other clothes to protect skin.

Sunscreen works best when used with shade or clothes, and it must be re-applied every two hours and after swimming, sweating, and toweling off.
